

# A tool to identify large-scale dynamical precursors of European extreme precipitation

A W2W Transfer project in collaboration with ARPAE Bologna and ECMWF

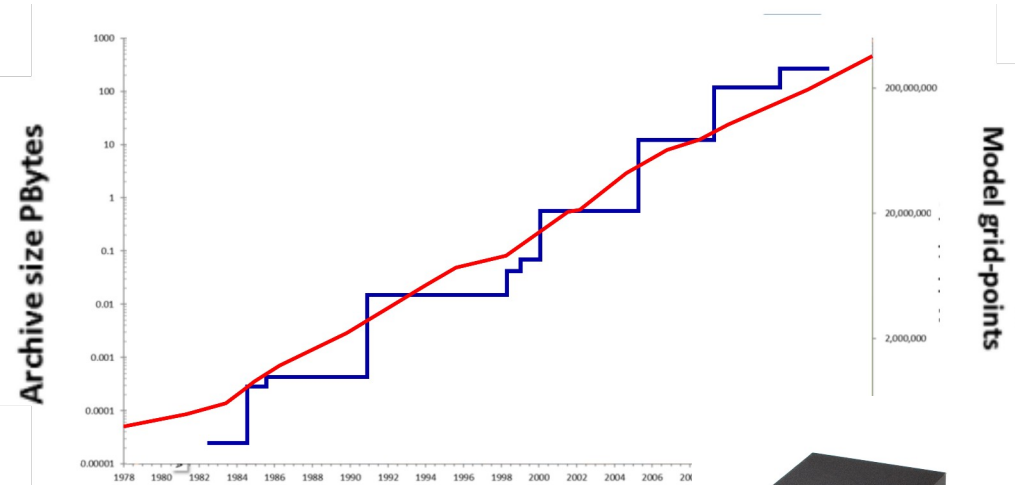

- **Josh Dorrington** and Christian Grams (KIT IMK-TRO)
- Federico Grazzini (LMU)
- Laura Ferranti, Linus Magnusson, Frédéric Vitart (ECMWF)

# We are increasing skill but also data

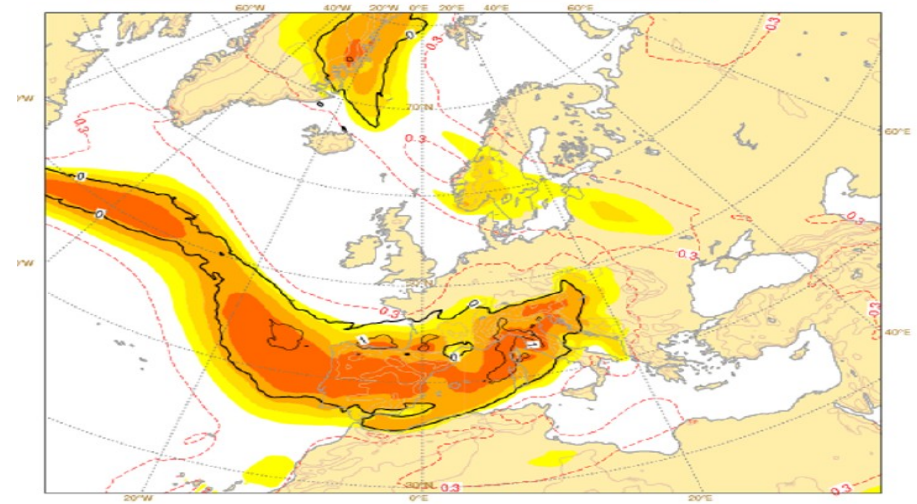

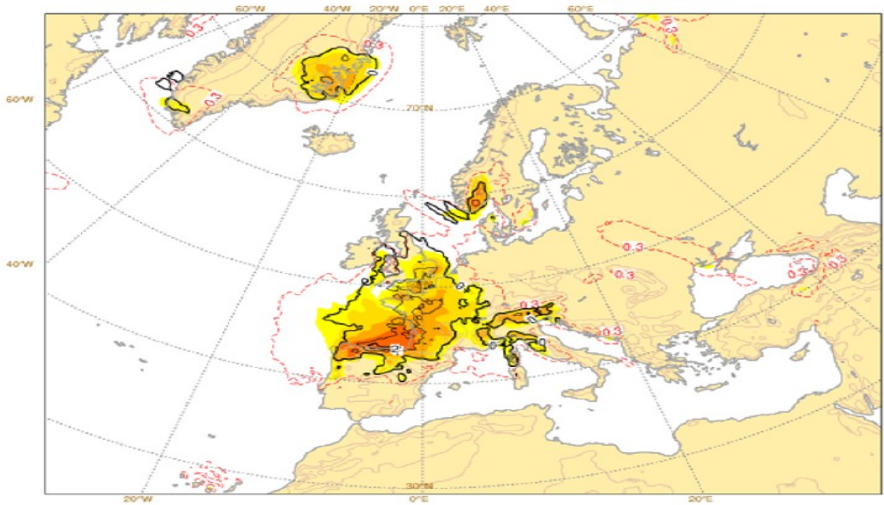

## Linear skill increase

## Exponential increase in data

As data volumes expand, models are becoming increasingly a black box

Direct precip forecast

Integrated vapour transport

Extreme Forecast Index, +96h forecast

**Storm Alex,**

**03.10.2020**

500mm precip in 12 hr!

Every weather event  
(and every forecast)  
has a **story**

Mapping out the  
**large-scale precursors**  
of an event makes it  
easier to understand  
and predict

# Extreme rainfall definition

- Looking at 90<sup>th</sup> percentile extremes relative to a monthly climatology in ERA5
- Looking only at 1<sup>st</sup> day of multi-day events – 6.5% occurrence
- For SON ~260 events between 1979-2021

# Theory to forecasting in NI Rainfall prediction

In previous project T1 we have identified 3 EPE types: Cat1, Cat2, Cat3. They are characterized by different ingredients and predominance of dynamic vs thermodynamic processes

# Precursors from different forecast days can be used together

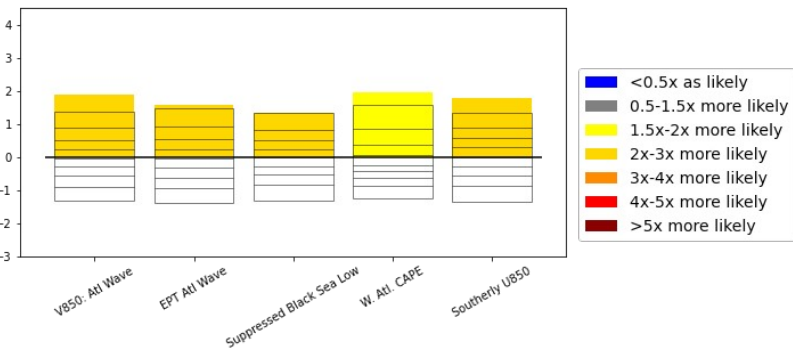

Lag 4 Precursor activity for 2020-10-03 12:00:00

**4 days before:  
Elevated wave activity**

Lag 2 Precursor activity for 2020-10-03 12:00:00

**2 days before: Strong  
wave, high CAPE, low  
pressure**

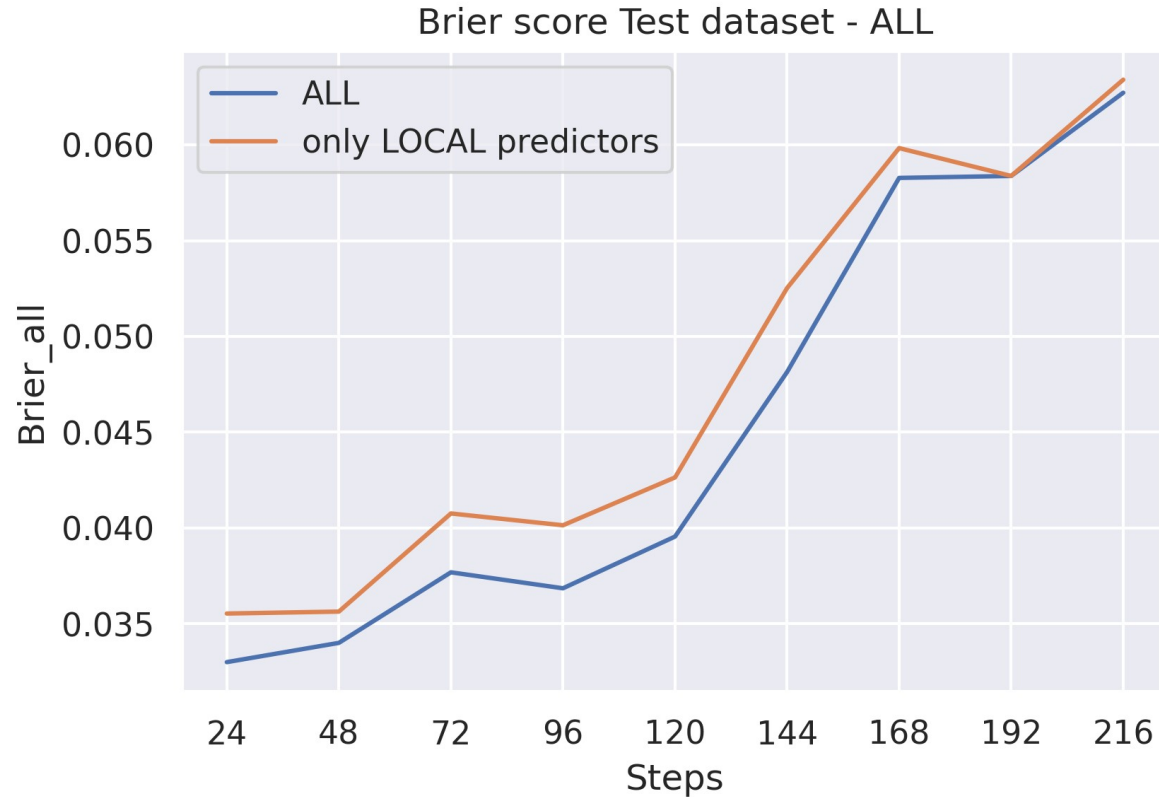

Lag 0 Precursor activity for 2020-10-03 12:00:00

**Day 0: Extreme IVT,  
strong trough and CAPE**

# Including nonlocal predictors improves the RF

# Current challenges

- Identifying the presence of multiple pathways into an extreme event
- 
- Handling seasonality: trade off between sample size and uniqueness of dynamics
- 
- How to best supplement ensemble forecast data with the precursor analysis?

# Conclusions and future development

- We are working towards summarising the high dimensional atmospheric circulation in a data-efficient and application relevant way
- Our automated approach can be easily extended to different event definitions
- Integrate with IFS to track precursors in model output and ultimately develop hybrid system
- Report near-realtime precursor activity, computed from ERA5, as a public web-app
